

STM TripModifications

Detours whose cancelled range is shorter than the detour itself

In a detour at the end of a line, the cancelled range collapses to a single stop while the detour shape published in the same entity skips a longer run of stops. The stops in between stay in the trip although the vehicle never reaches them, and a stop the vehicle no longer serves is sometimes re-added as a replacement stop. Detours in the middle of a line are correct. Each page below shows one affected modification: the same detour shape in both panels, the stops as the feed claims them on the left, and as the shape implies them on the right.

A stop is taken to be unserved when it lies more than 100 m from the detour shape. Stops the vehicle does serve measure 0–26 m from it; the errors below measure 94–471 m, so the reading does not depend on where in that gap the line is drawn.
